

Uninterruptible Power System

Delivering *Extra Power Protection* for **PARTNER**[®] Telephone Systems

According to a report from the National Power Laboratories, the typical office experiences *289* potentially disruptive or destructive power disturbances *each year*.

Without the right power protection, your business communications may be vulnerable not only to blackouts, but also to data loss or equipment damage from power sags, spikes, and surges. A power outage or damage can mean lost time and lost revenue.

PARTNER[®] telephone systems are equipped with *built-in surge and lightning protection* and *Power Failure Transfer* to help protect your products during a power outage.

And now, for *additional power security*—whether your business is in a lightning-prone area, has extensive data requirements, or absolutely *must* be available—you can take advantage of an **Uninterruptible Power System (UPS)** from Lucent Technologies.

Protection for Your Phones, Equipment, and Data

UPS products provide reliable power for your business communications, and an insurance policy for your equipment—your computer as well as your **PARTNER** telephone system.

UPS gives you backup power during outages, and helps protect equipment from damage that can be caused by fluctuation in power levels. UPS can also help protect your data from surges, spikes, brownouts, frequency variations, and utility failures, which account for nearly 50% of all data loss at computer installations.

A UPS solution configured to include your **PARTNER**, voice mail, data, and computer systems will help you:

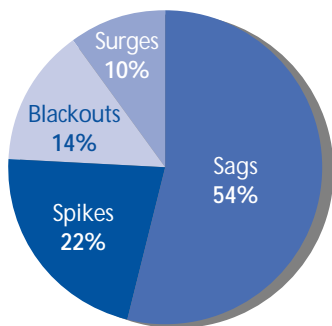

- Reduce downtime, and maintain productivity levels.
- Provide reliable service to customers and clients.

- Protect software and data from loss—saving you precious time re-programming your PC or recreating customer files, financial records, reports, and other valuable information.
- Reduce service calls to repair or reprogram your equipment.
- Protect your hardware from irreparable damage—and in turn, protect your equipment investment.

Protecting a Wide Range of Business Applications

UPS is an invaluable solution for any business where keeping communications up and running is critical to success:

- Ambulance squads, crisis centers, and other facilities that must be available 24 hours a day
- Technical support or help-desk providers whose clients and customers rely on them for information
- The at-home or remote worker whose communications system is a crucial link to employers and clients
- Florists, bakeries, pizza parlors, and other retailers who rely on the phone to take orders

Blackouts aren't the only power disturbances that can routinely disrupt your business communications.

- Vendors who rely on their computer to maintain up-to-date inventories
- And many more.

Modular Systems That Provide the Right Level of Protection

The Lucent Technologies family of UPS products offers an array of protection levels to choose from, based on your business needs, communications system complexity, and budget.

- **Standby (or Off-Line) UPS** is an economical solution for noncritical applications that require minimal extra protection, such as a system with a single-user PC or home office. During blackout conditions, when voltage or frequency changes become severe, Standby UPS converts DC battery power to AC power to run the protected equipment.
- **Line-Interactive UPS** provides basic power protection, offering low-grade regulation by “boosting” utility voltage up or down before allowing it to pass through the protected system. The Line-Interactive UPS battery helps provide extra protection for a larger workstation environment.
- **Online UPS** offers the greatest level of protection for communications and computing applications. It constantly protects sensitive equipment from power fluctuations caused by brown-outs, spikes, surges, line noise, and frequency variations, and produces sine-wave AC power as backup during blackouts. We can configure from 8 minutes to 8 hours of battery backup to meet your needs.

Protection That Can Keep Pace with Your Business Needs

Like the **PARTNER** telephone systems, your UPS keeps working for you as your business needs grow. Simply re-allocate your UPS resources and add capacity as necessary—for example, if you add employees to your business, require a more advanced **PARTNER** system, or integrate more PCs into your workplace.

Best of all, with Lucent Technologies UPS, you get the peace of mind that comes with knowing that your vital business communications investments—your telephone sets and control unit as well as your PC and other equipment that you have integrated into your **PARTNER** system—are protected.

Ask the Experts

A company including Bell Laboratories and former manufacturing units of AT&T, Lucent Technologies is a leader in delivering communications solutions for businesses.

To learn which Uninterruptible Power System is right for your business communications needs and your **PARTNER** telephone system, just ask your Lucent Technologies representative or Lucent Technologies Authorized Dealer or Sales Agent. And, visit our Web site at [www.lucent.com/smallbusiness].
